ELECTRICITY REGULATORY AUTHORITY

Uganda Renewable Energy Feed-in Tariff (REFIT)
Phase 2
Approved Guidelines for 2011-2012

1 Introduction

1.1 These guidelines are meant to provide clarity and guidance to project developers and investors and key institutional stakeholders, on the key components and operational structure of the Renewable Energy Feed-in Tariff (REFIT).

1.2 Under the Renewable Energy Policy (2007), a REFIT was initially established in Uganda which ran from 2007 to 2009. This is referred to from hereon as REFIT Phase 1.

1.3 Due to limited uptake by project developers, the REFIT was reviewed in 2010 and a new tariff was developed based on updated levelised costs of production, accompanied by these guidelines. This is referred to from hereon as REFIT Phase 2.

2 Objective and Key Principles of the REFIT

Policy Context

2.1 The overall aim of the REFIT is to encourage and support greater private sector participation in power generation from renewable energy technologies, through the establishment of an appropriate regulatory framework.

2.2 This is in line with the Renewable Energy Policy 2007, whereby Government's policy vision for renewable energy is "To make modern renewable energy a substantial part of the national energy consumption".

2.3 The Renewable Energy Policy 2007 defines modern renewable energy as renewable energy resources that are transformed into modern energy services such as electricity, which can be generated from solar energy, wind power, water power, geothermal energy and biomass cogeneration. In addition, it also refers to clean fuels derived from renewable energy resources like biogas, ethanol, methanol, hydrogen or solar water heating as well as biomass utilised in efficient biomass technologies, like improved charcoal stoves and improved firewood stoves.

2.4 Renewable energy in the context of the REFIT is defined as electricity which can be generated from energy resources such as water power, wind power, solar energy, geothermal energy, biogas and landfill gas combustion, and biomass cogeneration. A full definition of renewable energy and the relevant technologies is provided in Appendix 4.

2.5 The REFIT shall apply to small-scale renewable energy systems, of prescribed priority technologies, up to a Maximum Installed Project Capacity of twenty (20) MW, and greater than 0.5 MW, as defined by the Electricity Act 1999.

Key Principles of Feed-in Tariffs

2.6 Feed-in tariffs (FIT) are an internationally recognised regulatory mechanism used to promote and increase the amount of electricity generated from renewable sources, by providing a fixed tariff based on the levelised cost of production for a guaranteed period of time. FITs have numerous advantages and benefits which include:

- ***Improved energy security***—fuel is renewable, accessible, and "indigenous", enhancing national security.
- ***Reduced environmental impacts***—direct environmental impacts as well as externalities associated with conventional electricity production, such as water and air pollution, land use change and biodiversity loss are significantly reduced. Electricity generation from renewables also significantly reduces greenhouse emissions.
- ***Economic growth and stimulation***—stimulates the creation of "green" jobs, promotes a competitive manufacturing industry and can allow for revenues to be kept within a country. Additionally, FITs can lead to a decrease in electricity tariffs in the long-term.
- ***Diversified electricity supply mix***—FITs can promote production of electricity from a diversified set of technologies. A technology-specific approach to the establishment of tariffs allows for the development and deployment of a wide range of renewable energy technologies.
- ***Investment security for developers:*** The penetration of renewable energy into the market largely hinges on investment security. With a FIT, the risk premium required by investors can be minimised by the high level of price security in the system. Tariffs provided are high enough to cover investment costs and provide a reasonable rate of return. The long-term certainty provided also stimulates investment in relevant technologies, training and building capacity.
- ***Industry competition:*** A FIT encourages competition with the tariff gradually reducing as the industry matures. In the long-term, the establishment of a renewables industry drives down the cost of renewable energy power generation due to learning effects and the development of institutional expertise. This increases renewables' competitiveness with conventional technologies whilst driving down costs for consumers.
